AusAID

Learning outcomes

On completion of this unit, you will understand:

- The defining characteristics of Environmental Accounts and how these differ from environmental statistics
- The Statistical frameworks described by the SEEA-2012 and their relationship to the SNA.

The Environment in National Accounts

... a country could exhaust its mineral resources, cut down its forests, erode its soil, pollute its aquifers, and hunt its wildlife to extinction, but measured income would not be affected as these assets disappeared (Repetto et al, 1989).

Setting the Scene

Discuss the following questions in groups:

1. What do you think environmental statistics are
2. What do you think environmental accounts are?

What are environmental statistics?

Statistics - the process of *collecting, organising and interpreting* numerical data about observable phenomena

- are commonly compiled with a particular regulatory or administrative purpose in mind
- use a variety of concepts, methods and classifications
- are often not well integrated with other datasets
- Environmental statistics may assist in the formulation and evaluation of socio-economic and environmental policies

Limitations of environmental statistics

- Data developed to answer one particular question or problem
- Difficult to figure out if all information is included
- Not always easy to see the whole picture, or how it relates to other things

Examples of Environmental Statistics produced by the ABS:

ABS Cat.No.4602.0 *Environment Issues – People’s Views and Practices. March 2007*

ABS Cat.No.4602.0.00.002 *Community Engagement with Nature Conservation, Australia, 2011-12*

ABS Cat.No.4615.0 *Salinity on Australian Farms, 2002.*

ABS Cat.No.4626.0.55.001 *Environmental views and behaviour, 2011-12*

ABS Cat.No.4656.5 *Household Choices Related to Water and Energy, WA, October 2009*

ABS Cat. no. 5204.0 *Australian system of National Accounts, 2012-13*

Why do we need environmental-economic information?

- The quality of the environment impact human welfare an important policy issue
- concern about impact of economic activity on the environment
- continuing economic growth and human welfare depend on the environment
- are environmental endowments being used responsibly and **sustainably**?

What is sustainable development?

This concept is difficult to define. Here is the UN definition:

Development that meets the needs of the present without compromising the ability of future generations to meet their own needs.

Reference

UN (1987) *Our Common Future*: Report of the World Commission on Environment and Development. Transmitted to the General Assembly as an Annex to document A/42/427 — Development and International Co-operation: Environment. Oxford: Oxford University Press.

Integration of issues

There has been a shift in policy focus away from considering the economy, society and the environment as separate issues, to a more integrated approach aimed at sustainable development.

Accounting frameworks have the potential to link economic, social and environmental data, proving useful to structure economic statistics, and derive economic indicators.

Role of Environmental Accounts

Environmental (or *environmental-economic*) accounts are a tool to measure sustainability of economic behaviour.

These accounts provide an integrated framework for consistent analysis of the contribution of the environment to the economy, and the impact of the economy on the environment.

Why an accounting approach?

- encourages the adoption of standards
- generates consistency
- implicitly defines ownership (and hence responsibility) for environmental impacts
- encourages the development of comprehensive datasets
- facilitates international comparisons

Environmental Accounts

- Help make sense of the larger picture
- Helps to identify pieces that are missing
- Can make connections to other statistics – especially economic statistics

Source: Julie Hass, Statistics Norway

History of SEEA

Integration of these concerns required development of a statistical framework that combined the System of National Accounts — an economic tool — with appropriate environmental and social indicators:

- Rio Conference (1992)
- Agenda 21 proposed 'a program to develop national systems of integrated environmental and economic accounting in all countries'.

SEEA: A Framework for Environmental Accounts

In 1993, the United Nations endorsed the link between GDP and the environment:

- 1993
 - Publication of Interim version (SEEA-1993)
 - Established the London Group
 - 1993 SNA included a chapter on **satellite accounts**
- 2003
 - Publication of SEEA-2003
 - Established the London Group
- UNSC at its 2006 session established the mechanisms to elevate SEEA to status of an international statistical standard:

SEEA: A Framework for Environmental Accounts

- *System of Environmental-Economic Accounting – Central Framework* (SEEA-2012) adopted as an international standard at the United Nations Statistical Commission (UNSC) in 2012
- environmental concerns to be integrated into mainstream economic reporting by member countries

System of Environmental-Economic Accounting – Central Framework

Summary table of contents

Table of contents.....	iii
List of tables and figures.....	viii
Preface.....	x
List of abbreviations and acronyms.....	xx
Chapter 1: Introduction to the SEEA Central Framework	1
Chapter 2: Accounting structure	11
Chapter 3: Physical flow accounts.....	37
Chapter 4: Environmental activity accounts and related flows.....	87
Chapter 5: Asset accounts	123
Chapter 6: Integrating and presenting the accounts.....	217
Annex 1: Classifications and lists.....	248
Annex 2: Research agenda for the SEEA Central Framework.....	283
References	289
Glossary.....	295

SEEA main building blocks

1. Physical Supply-Use tables & hybrid Accounts
2. Physical Asset Accounts
3. Accounts for Economic Activities related to the environment
4. Valuing environmental assets

1. Physical Supply-Use (S-U) tables & hybrid Accounts

- Measures physical characteristics on production/consumption processes
- Main (S-U) flows are: natural resources; products; residuals
- Use the same economic classifications (ISIC/CPC) as the SNA
- Hybrid/Combined tables to produce indicators

Environmental accounts, what do they cover?

1. Physical Supply-Use (S-U) tables & hybrid Accounts *cont...*

Figure 1.3 GDP, population and selected physical indicators of environmental pressure, 2002-03 to 2010-11

Note: Index: 2002-03 = 1

Sources: ABS; Department of Climate Change and Energy Efficiency; Department of Sustainability, Environment, Water, Population and Communities.

2. Asset Accounts

SEEA Asset Classification

2. Asset Accounts *cont...*

- Measures wealth of environmental capital in \$\$\$ and physical terms
 - Inc. gains and losses
- Economic (SNA) environmental assets include
 - Land
 - Subsoil assets
 - Timber (plantation/native standing)
 - Fish stocks in open seas (some)
 - Water (possible)

2. Asset Accounts *cont...*

Environmental assets not included in ASNA:

- land with no 'economic' function
- sub-economic subsoil assets unavailable for economic exploitation
- water
- fish stocks in territorial waters
- native standing timber unavailable for economic exploitation
- other biological resources (e.g. native fauna)
- Biodiversity
- Amenity (Land)

2. Asset Accounts *cont...*

Australia's Capital Base
Produced Capital vs Natural Capital

3. Valuing Environmental Assets

Market prices are preferred for the valuation of environmental assets.

In the absence of market prices both the SNA and SEEA (Central Framework) recommend the net present value (NPV) method.

This method is used to value some natural resource assets in the National Balance Sheet e.g. subsoil assets.

3. Valuing Environmental Assets: Subsoil

Various minerals are recorded on Australia's balance sheet, including coal, oil and natural gas reserves.

Subsoil assets in scope of the ASNA balance sheet meet the following criteria:

- Economically demonstrated reserves (EDRs)
- extraction is expected to be profitable at prevailing prices with existing techniques, and
- they are owned by an economic entity (typically the government).

3. Valuing Environmental Assets cont...

What precisely is the economic benefit attributable specifically to owning and using mineral and energy resources?

- *Gross output* - less the cost of intermediate goods and services (to give gross value added), and *less compensation of employees* = GOS
- Not all of the firm's operating surplus can be attributed to the mineral and energy resource...
- Concept of resource rent

3. Valuing Environmental Assets: Subsoil *cont...*

Gross Operating Surplus: **Resource rent**

3. Valuing Environmental Assets: Subsoil *cont...*

ASNA uses the NPV method to value subsoil assets:

$$V_t = \sum_{t=1}^n \frac{RR_t}{(1+r)^t}$$

where

V	= net present value
RR	= resource rent
r	= discount rate
n	= asset life

Asset life equals EDR at the end of the year divided by the five-year moving average of production.

The discount rate used is the "large business borrowing rate", as published by the Reserve Bank of Australia. This rate represents the opportunity cost to mining companies for funds invested in extraction.

3. Valuing Environmental Assets: Depletion

Depletion — monetary (not physical) — arises when the value of a resource stock falls due to its use in productive activity. This use reduces the asset's ability to produce an income stream into the future.

Depletion in any one year is the change in the value of the asset between the beginning and end of the year, arising purely from its physical extraction.

3. Valuing Environmental Assets: Degradation

- Land degradation represents the real decline in land value resulting from declining quality of land.
- Land values are affected by multiple influences:
 - technological advances
 - water availability,
 - land use changes,
 - 'lifestyle' considerations, and
 - proximity to urban populations

3. Environmentally—adjusted macroeconomic indicators

How do we calculate a measure of GDP that accounts for demands on the environment? No consensus on how "green GDP" is to be calculated. SEEA discusses adjustment of GDP for depletion of natural resources

Environmentally-adjusted Net Domestic Product (eaNDP) is the most commonly quoted indicator:

- focusses attention on depletion and degradation of natural capital

Case Study: Nauru

What do you think Nauru's national accounts might show in 1975 and 2005?

e.g. production (GDP), income *etc.*

Do you think accounting for the environment could have helped Nauru?

Nauru National Accounts 1975 & 2005 (theoretical excerpt)

1. Production account

	1975	2005		1975	2005
Uses	\$m	\$m	Resources	\$m	\$m
Intermediate consumption	370	55	Output	665	120
Gross domestic product	295	65			
Consumption of fixed capital	10	2			
Net domestic product	285	63			

2. Generation of Income account

	1975	2005		1975	2005
Uses	\$m	\$m	Resources	\$m	\$m
Compensation of employees	205	45	Net domestic product	285	63
Net operating surplus	80	18			

3. Allocation/distribution of income account

	1975	2005		1975	2005
Uses	\$m	\$m	Resources	\$m	\$m
Interest paid to overseas	5	40	Net operating surplus	80	18
			Compensation of employees	205	45
			Interest received from overseas	75	10
			Current international cooperation	2	35
Net disposable income	357	68			

4. Use of income account

	1975	2005		1975	2005
Uses	\$m	\$m	Resources	\$m	\$m
Final consumption expenditure	305	110	Net disposable income	357	68
Saving	52	-42			

5. Capital account

	1975	2005		1975	2005
Changes in assets	\$m	\$m	Changes in liabilities and net worth	\$m	\$m
Gross fixed capital formation	35	5	Saving	52	-42
Net lending (+)/Net borrowing (-)	17	-47			

Nauru National Accounts 1975 & 2005, adjusted for depletion (theoretical excerpt)

1. Production account

	1975	2005		1975	2005
Uses	\$m	\$m	Resources	\$m	\$m
Intermediate consumption	370	55	Output	665	120
Gross domestic product	295	65			
Consumption of fixed capital	10	2			
Consumption of natural capital	200	40			
Adjusted net domestic product	85	23			

2. Generation of Income account

	1975	2005		1975	2005
Uses	\$m	\$m	Resources	\$m	\$m
Compensation of employees	205	45	Adjusted net domestic product	85	23
Adjusted net operating surplus	-120	-22			

3. Allocation/distribution of income account

	1975	2005		1975	2005
Uses	\$m	\$m	Resources	\$m	\$m
Interest paid to overseas	5	40	Adjusted net operating surplus	-120	-22
			Compensation of employees	205	45
			Interest received from overseas	75	10
			Current international cooperation	2	35
Adjusted net disposable income	157	28			

4. Use of income account

	1975	2005		1975	2005
Uses	\$m	\$m	Resources	\$m	\$m
Final consumption expenditure	305	110	Adjusted net disposable income	157	28
Adjusted saving	-148	-82			

4. Accounts for economic activities related to the environment

- Measures the financial aspect of economic response to environmental issues
- Environmental Protection Expenditure
- Environmental Goods and Services
- Environmental tax & subsidies

EPE Quiz

1. Scrubber for removing sulphur from coal
2. Collection and transport of waste by municipal authorities
3. Safety features installed on a nuclear power plant
4. Compost (i.e. result of composting activity)
5. In-roof insulation installed in private homes adjacent to Sydney airport
6. Construction of screens / hedges to reduce sound impact of motorways
7. Building and maintaining forest fire roads
8. Shotgun used strictly for feral cats

4. Accounts for economic activities related to the environment *cont...*
